

Problem Statement No. 3 – AI Agent for NAAC Accreditation Processes (RAG Based)

The Challenge

An AI-powered assistant based on Retrieval-Augmented Generation (RAG) is designed to assist faculty members throughout the NAAC accreditation process. The system retrieves institutional data, historical reports, and official NAAC guidelines to provide accurate, context-aware support.

Faculty can interact with the agent to generate Self-Study Report (SSR) drafts, criteria-wise inputs, best-practice documentation, and accreditation-related content. The RAG architecture ensures that responses are grounded in trusted institutional records and official NAAC documentation.

By automating repetitive documentation tasks, the solution improves accuracy, reduces preparation time, streamlines compliance activities, and enables faculty to focus on quality improvement initiatives.

Mandatory Technology Requirements

- Use of IBM Cloud Lite Services is mandatory.
- IBM Granite models must be used as the primary AI/LLM component.
- The solution should implement a Retrieval-Augmented Generation (RAG) framework to ensure reliable and context-aware responses.

Expected Outcome

Develop an AI-driven NAAC Accreditation Assistant that simplifies accreditation workflows, enhances documentation quality, improves compliance accuracy, reduces faculty workload, and supports institutions in achieving efficient and successful NAAC accreditation outcomes.
